VANDAR DASHBOARD PAY OUT SERVICE

UX Improvement

Overview

About project and Objective

About Project:

Vandar is a B2B financial platform for Payment and payout and managing money for Business.

In the Vandar dashboard, payout service allows users to transfer their wallet balance to their bank account.

Objective:

- The most part of the dashboard that users deal with daily is Payout.
- **15%** of all problems were allocated is payout.
- Resolving payout problems consumed a lot of the support team's time.

Overview

Team

I designed this project along with the supervisor, by collecting data and analyzing it together. We categorized the data and discussed potential solutions to achieve our goals.

Mina Zahedi | Design lead | Empathy, Define step

Kiana Mousavi | Product designer | All steps

Empathy

User feedbacks

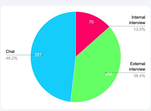
We were aware of the problems, but we extracted the following data to validate the problems and prioritize them:

1.Internal interview

2.Customer interview

3.Online chat data

At this stage, we considered specific categories for each similar problem according to the feedbacks.



- This chart shows how much each section has been discussed and needs to be examined

Define

Data analyze

we categorized the issues and placed them in their sections.

Result:

- 20 % Create business account
- 16 % Payout service
- 12% IPG service

Define

Flow

Further investigation into this issue has revealed the following reasons for the lack of settlement or delayed settlement:

- In the following flow, the sections that require notification messages have been identified.

Problem solving

Solutions

After reviewing all the extracted issues, we reported a number of bugs to the technical team to be resolved, and we outlined the design-related issues in the following problem statement.

- Reasons for the lack of settlement or delayed settlement:

UX & Functional problems

The system does not inform users about the status of their transactions or when they are complete.

Technical bug

The system does not update the deposit time.

Problem statement

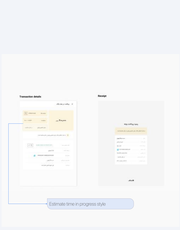
"Our users are experiencing dissatisfaction and lack of confidence in our service due to inadequate handling of their complaints, lack of transparency in the deposit process, and failure to notify them about delayed settlements of their transactions."

Outcome

UI Design

- **Notify users in transaction part**

Notify users in transaction details and receipt, true estimated time and if we cant estimate it let user know that we show it soon.



Outcome

UI Design

- **Notify users in Dashboard notification**

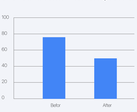
We need to send messages to users in the following parts:

- If there are any errors or issues with the settlement request that require manual review
- If there are any delays in the settlement process beyond the estimated deposit time
- When the settlement has been successfully deposited into the user's account.

Test

Evaluate design

The data that we extracted at the beginning of the project covered a two-month period, and out of 54 topics discussed, 41 were related to tracking the settlement status. After implementation, we reviewed this data again and found some interesting results.



Result:

- Based on this calculation, it appears that the percentage decrease in support visits in the past two months has been around

32.33%.
