SELF ORDERING PIZZA WIFI

Redesign Project

Overview

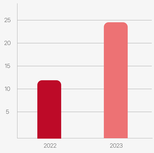
About project and Objective

About Project:

We decided to redesign self-ordering TV because one of the most important Competitive Advantages of Pizza wifi is self-ordering TV and we need to improve user experience.

We need to be sure that our users use TV's for ordering pizza so we gather data from all branches.

According to the statistics obtained from July 2022 to June 2023, after orders registered through branch cash registers, the highest volume of orders is through the TV app.



In 2022, 19.4% of total orders were registered through the TV app, and in 2023, it increased to 24.7%, indicating a rise in the usage rate.

Overview

Team

We were 2 product designer on this project, by collecting data and analyzing it together. We categorized the data and discussed potential solutions to achieve our goals.

Neda Samimi | Product designer

Empathy

Competitor analyzes

KFC

Advantage
Convenience and Efficiency - Self-ordering screens at KFC allow customers to independently browse the menu, customize their orders, and complete transactions, reducing waiting times and streamlining the ordering process.

Disadvantage
Limited Human Interaction - Some customers may prefer the personal interaction with a human cashier and may feel that self-ordering screens lack the human touch and personalized service.

McDonald's

Advantage
Reduced Waiting Times - This is one of the most crucial advantages your business can benefit from. An interactive kiosk is a proven method that business owners capitalize on when it comes to reducing waiting times. Retailers who offer a self-service option have witnessed a 40% decrease in customer wait times.

Disadvantage
Technical Issues - Like any technology, self-service kiosks can experience technical glitches, such as freezing screens or unresponsive touchscreens. These issues can frustrate customers and lead to delays in ordering.

Empathy

Interview

Branch managers

Managers are focused on delivering an exceptional customer experience. They need self-ordering TVs to enhance customer satisfaction, offering intuitive interfaces, clear instructions, and options for enjoyable customization

Define

Categorize Issues

- **Technical Problems**

We tested the TV's to find potential problems:

Examples:

- Suddenly Zoom in Zoom out
- Touch screen delay (Keyboard, Tab Scroll)

- **UX/UI Problems**

Issue's extract from expert review and user observation:

- Redesign ordering flow
- Improve customization order pizza

Example:

- Its hard for users to find keyboard to type the pizza names

- **Requirements**

From user observation 4 issue's raised to improve UX:

- List patterns from users Behavior

Example:

- Some users click twice in the food icon for delete the item.

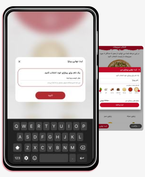
Problem solving

UX/UI Problems

Issue:
Its hard for users to find keyboard to type the pizza names

Description:
In this case users have to name their customized pizza, the problem is when their tap the text field keyboard shown up and users confused.

Solution:
The keyboard should be open immediately in this step.



Problem solving

Requirements

Issue:
Some users click twice in the food picture for delete the item

Description:
If users want to delete one of the items they should tap the delete icon, however, in observation users assume by double tap they can delete the item

Solution:
We added this interaction to the system for improving use of app

Outcome

Conclusion

We categorized about 10 issues and some of them are technical and we decided to report them to technical team and follow up them, most of them are UX problems so we solve them in design and handoff to product team, also, we have some users requirements that we consider them in design

After all we decided to divide redesign to 3 parts to be Implementable:

1. Usability problem and improvements
2. User flow improvements
3. Interface design improvements
